1. Planning in Software testing:

Defining objectives:

Establish clear and measurable testing objectives, aligning them with overall project goal and user requirments.

Scope Definition:

Determine the scop of testing including types of testing (e.g Functional, Performance Security) test levels (e.g unit integration System) and methodologies (e.g Agile waterfall)

Strategy and Approach:

Outline the testing strategy, including types of testing (e.g Functional Performance Security), test levels (e.g unit, integration, system) and methodologies (e.g Agile waterfall).

Resource Allocation:

Identify and allocate necessary resources, including personnel, tools environments and budget.

Shedule and Milestones:

Create a detailed testing shedule with defined milestones dependencies and timelines

Risk Assessment and mitigation:

Identify potential risk to the testing process and develop mitigation strategies.

Entry and Exit Criteria:

Define clear criteria for entering and exiting each test phase.

Test Deliverables:

Specify the expected outputs of the testing process, such as test plans test cases, defect reports and summary reports.

2. Control Activity In Software testing:

Control Activity In Software Software testing means ensuring that the testing Process and Correcting any deviations.

Deviation Management:

Deviation management means Identifying differences between the Planned testing activities and the actual testing Progres.

Change management:

During the Project, Requirement or test plans may change and

If a New feature is added to the Application, New test Cases Must be Created And test plan Should be updated.

Defect management:

Defect management is the process of logging, tracking, prioritizing, and resolving defects.

Resource Adjustement:

Adjust resource allocation as needed based on monitoring data and changing project

Risk mitigation implementation:

Execute planned risk mitigation strategies and develop new ones for emerging risks.

Decision making:

Make informed decisions based on monitoring data to optimize the testing process and achive testing objectives.
