1. QA (Quality Assurance):

Quality Assurance (QA)

is a Proactive, Process-oriented approach that aims to Prevent by improving development Processes.

QC (Quality Controll):

Quality Control (QC) is a reactive, Product-oriented approach that aims to detect and correct defects.

QA vs QC:

Feature	Quality Assurance	Quality Control
Approach	Proactive; Focuses on Preventing defects	Reactive; Focuses on finding and correcting defects.
Focus	The Process and System used to Create the Product	The Final Product itself
Goal	To improve the development Process and Prevent future errors.	To identify and fix defects in the current Product.

Timeline	occurs throughout the entire product life cycle before and during development	Primary occurs at the end of the development cycle during the testing phase.
Responsibility	Involves the entire team	usually performed by a dedicated quality control team or specific personal
Activities	Process planning, setting standards code reviews and training	Inspections, testing, bug fixing and user acceptance testing.

2. Explain about QA Testing:

Tester:

* A tester is a individual who performs quality control activities specifically the execution of test cases to find bugs and issues in a software product.

* Testers are a part of the QC process which falls under the border umbrella of QA.

STLC :

* Software testing life cycle is a sequence of different testing phases followed during the software testing process to ensure software quality.
